                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Creplacing the mitochondrial targeting sequence (residues 1-55 of (I)), and an inhibitor of BID (Bcl2 interacting cd domain) with a compound to be tested for apoptotic inhibiting activity; (C) (b) incubating the cell populations with a direct stimulus of the cell populations, where inhibition of the specific apoptotic activity of the cell populations, where inhibition of the specific apoptotic activity is cell populations, where inhibitor of the specific apoptotic activity is indicative that the compound is an inhibitor of apoptosis. (I) and (II) are useful for inducing apoptosis in a cell. The Smac polypeptide and polynucleotide are useful for stimulating apoptosis in a neoplastic or tumour cell which overexpresses an inhibitor of caspase. Where the cell polynucleotide are useful for stimulating apoptosis in a neoplastic or caspase. Perferably, the cell overexpresses at least a portion of IAP. (I) suseful for identifying an inhibitor of caspase. Where the cell is useful for identifying an inhibitor or enhancer of a caspase. (I) and (II) is useful for identifying an inhibitor or enhancer of a caspase. (I) and (II) transferred or captase and an expressing (I) with a candidate inhibitor or call viability indicates the presence of an inhibitor and a decrease in cell viability indicates the presence of an inhibitor and a decrease in cell viability indicates the presence of an inhibitor and a decrease in cell viability indicates the presence of an inhibitor and a decrease in cell viability indicates the presence of an inhibitor and a decrease in cell viability indicates the presence of an inhibitor and a decrease in cell viability indicates the presence of an inhibitor and a decrease in the processing indicates the presence of an inhibitor and an increase in the processing indicates the presence of an inhibitor and an increase in the processing indicates the presence of an inhibitor and an increase in the processing indicates the presence of an inhibitor and an increase in the processing indicates the presence of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Loc

Q
                                                                                                                                                                                                                               CC transfected with a vector expressing (I) with a candidate inhibitor or CC candidate enhancer; and detecting cell viability, where an increase in CC cell viability indicates the presence of an inhibitor and a decrease in CC cell viability indicates the presence of an enhancer. Optionally, the CC method involves detecting the presence of large and small caspase CC subunits after contacting cell transformed with the vector expressing CC (I), with the candidate compound. A decrease in processing indicates the presence of an inhibitor and an increase in the processing indicates the presence of an enhancer. Preferably, the large and small subunits of CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for CC ciapnitying a compound that inhibits Smac binding to Smac-binding CC molecule (a portion of IAP e.g. a BIR domain such as BIRI, BIR2 or BIR3, CC or a full-length IAP). (II) is useful in gene therapy techniques. The present sequence represents the amino acid sequence of Smac peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The invention relates to an isolated Smac peptide or polypeptide (I) CC and an isolated nucleic acid (II) encoding (I). Also described is a CC method of identifying a compound that inhibits apoptosis, comprising: CC (a) separately contacting several cell populations expressing a CC replacing the mitochondrial targeting sequence (residues 1-55 of (I)), CC and residues 56-60 of (I)) and an inhibitor of BID (BCl2 interacting CC domain) with a compound to be tested for apoptotic inhibiting activity; (C) incubating the cell populations with a direct stimulus of the cell (CC (b) incubating the cell populations with a direct stimulus of the cell cell pathway; and (c) measuring the specific apoptotic activity of the cell populations, where inhibition of the specific apoptotic activity is CC indicative that the compound is an inhibitor of apoptosis. (I) and (II) CC are useful for inducing apoptosis in a neoplastic or tumour cell which overexpresses an inhibitor of caspase-7 or CC caspase-9. Preferably, the cell overexpresses at least a portion of IAP. (I) is useful for identifying an inhibitor or enhancer of a caspase-CC mediated apoptosis which involves contacting a cell transformed or transforted with a vector expression (I) with a capitate inhibitor or enhancer.
                                                                          Matches
                                                                                               Query Match

CC (a) separately contexting several cell populations appects, comprising:
CC replacing the mitochondrial targeting sequence (residues 1-55 of (I)),
CC and residues 56-60 of (J)) and an inhibitor of BID (BI2 interacting
CC domain) with a compound to be tested for apoptotic inhibiting activity;
CC (b) incubating the cell populations with a direct stimulus of the cell
CC death pathway; and (c) measuring the specific apoptotic activity of the
CC cill populations, where inhibition of the specific apoptotic activity is
CC indicative that the compound is an inhibitor of apoptosis. (I) and (II)
CC are useful for inducing apoptosis in a cell. The Smac polypeptide and
CC polynucleotide are useful for stimulating apoptosis in a neoplastic or
CC tumour cell which overexpresses an inhibitor of caspase-3, caspase-7 or
CC caspase-9. Preferably, the cell overexpresses at least a portion of IAP.
CC (I) is useful for identifying an inhibitor or enhancer of a caspase-
CC mediated apoptosis which involves contacting a cell transformed or
CC call viability indicates the presence of an inhibitor or
CC call viability indicates the presence of an enhancer. Optionally, the
CC method involves detecting the presence of an enhancer optionally, the
CC caspase-3, caspase-7 or caspase-6 of an inhibitor and an increase in the processing indicates the
CC presence of an inhibitor and an increase in the processing indicates the
CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for
CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for
CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for
CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for
CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for
CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for
CC caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for
CC caspase-1 and caspase-1 or ca

                                                                                            The invention relates to an isolated Smac peptide or polypeptide (I) cand an isolated nucleic acid (II) encoding (I). Also described is a comethod of identifying a compound that inhibits apoptosis, comprising: CC (a) separately contacting several cell populations expressing a cytosolic Smac (a Smac isoform that begins with MKSDPYF sequence, CC replacing the mitochondrial targeting sequence (residues 1-55 of (I)), CC and residues 56-60 of (I)) and an inhibitor of BID (BCl2 interacting CC domain) with a compound to be tested for apoptotic inhibiting activity of the cell conclusing the cell populations with a direct stimulus of the cell cell populations, where inhibition of the specific apoptotic activity of the CC cell populations, where inhibition of the specific apoptotic activity is condicative that the compound is an inhibitor of apoptosis. (I) and (II) are useful for inducing apoptosis in a cell. The Smac polypeptide and CC polynucleotide are useful for stimulating apoptosis in a neoplastic or tumour cell which overexpresses an inhibitor of caspase. Where the CC inhibitor inhibits activation or activity of caspase 3, caspase-7 or CC caspase 9. Preferably, the cell overexpresses at least a portion of IAP. CC ill visuation of the presence of an enhancer of a caspase-C mediated apoptosis which involves contacting a cell transformed or call viability indicates the presence of an inhibitor and a decrease in CC cell viability indicates the presence of an inhibitor and a decrease in CC cell viability indicates the presence of an inhibitor and a decrease in CC cll viability indicates the presence of an inhibitor and a decrease in CC caspase-3, caspase-7 or caspase-6 are detected. (I) is also useful for caspase-7 or caspase-7 or caspase-7 or caspase-7 or caspase-8 in the processing indicates the presence of an inhibitor and small subunits of caspase-8 are detected. (I) is also useful for identifying a compound that inhibits small amino acid sequence of Smac C caspase-8 are detected. (I) is also useful for identificat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; inhibitor

Best Local
       binding molecule that specifically binds to DIABLO or its fragment, detecting DIABLO in a biological sample (by contacting the sample with an IAP and detecting the presence of an IAP/DIABLO complex), modulating the death of a cell (by contacting a cell with an agent, which modulates the level and/or functional activity of a polypeptide), a composition for treatment/prophylaxis of a DIABLO relate condition comprising an agent which reduces the level/activity of a polypeptide or DIABLO. DIABLO, or a nucleic acid encoding DIABLO, is useful for screening for an agent which modulates cell death. An antigen-binding molecule is useful for detecting DIABLO in a biological
                                                                                                                                              The invention relates to an isolated pro-apoptotic polypeptide, designated DIABLO, or its biologically active fragment of 8 amino aci in length. Also included are the polypucleotide encoding DIABLO, expression vectors, transformed host cells, producing a biologically active fragment of DIABLO (by contacting an inhibitor of apoptosis (I with a fragment of the polypeptide, and detecting a reduction in acti of the IAP), producing a natural or synthetic variant of DIABLO with cell death activity or which reduces IAP activity, an antigenwith cell death activity or which reduces IAP activity.
                                                                                                                                                                                                                                                                                                                                                                  WPI;
                                                                                                                                                                                                                                                                                 Disclosure; Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    autoimmune disease; neurodegenerative disease; hepatic muscular tissue damage; heart attack; hepatic tissue damage; liver disease; immunogen.

                                                                     The present sequence is the human Smac protein. Its coding sequence was isolated by purifying the protein and searching a HeLa cell cDNA library for sequences which bound to probes based upon it. Smac is a mitochondrial protein which is released into the cytosol during apoptosis, and acts as a caspase-3 activator. The protein and its coding sequence can be used to modulate the expression and function of caspases and their activators, and also can be used as drug targets and regulators to promote or inhibit apoptosis in the treatment of cancer and autoimmune and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Q
                                                                                     The invention relates to an isolated Smac peptide or polypeptide (I) CC and an isolated nucleic acid (II) encoding (I). Also described is a CC method of identifying a compound that inhibits apoptosis, comprising: CC (a) separately contacting several cell populations expressing a CC cytosolic Smac (a Smac isoform that begins with MKSDFYF sequence, CC replacing the mitochondrial targeting sequence (residues 1-55 of (I)), CC and residues 56-60 of (I)) and an inhibitor of BID (BC12 interacting CC domain) with a compound to be tested for apoptotic inhibiting activity; (b) incubating the cell populations with a direct stimulus of the cell cell populations, where inhibition of the specific apoptotic activity of the cell populations, where inhibition of the specific apoptotic activity is condicative that the compound is an inhibitor of apoptosis. (I) and (II) CC indicative that the compound is an inhibitor of caspase. Where the cumbination or activity of caspase-3, caspase-7 or CC tumour cell which overexpresses an inhibitor of caspase-7 or CC caspase-9. Preferably, the cell overexpresses at least a portion of IAP. (C i) is useful for identifying an inhibitor or enhancer of a caspase-CC mediated apoptosis which involves contacting a cell transformed or transfected with a vector expressing (I) with a candidate inhibitor or candidate enhancer; and detecting cell viability, where an increase in CC cell viability indicates the presence of an inhibitor and a decrease in CC cell viability indicates the presence of an inhibitor and adecrease in CC cell viability indicates the presence of an inhibitor and adecrease in CC cell viability indicates the presence of an inhibitor and adecrease in CC cell viability indicates the presence of an inhibitor and adecrease in CC cell viability indicates the presence of an inhibitor and adecrease in CC cell viability indicates the presence of an inhibitor and adecrease in CC cell viability indicates the cell compound. A decrease in processing indicates the compound in the cell cell cell cof
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel Smac peptides and polynucleotides encoding the peptides, useful for stimulating apoptosis in neoplastic or tumour cell which overexpresses inhibitor of caspase, and for identifying apoptosis modulating compounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2002-304115/34

                                                                                                                                           The present sequence is the protein sequence for human DIABLO/Smac, an inhibitor of inhibitor-of-apoptosis (IAP) proteins. The invention provides a nucleic acid, such as an antisense coliquoucleotide, which specifically hybridises to a nucleic acid encoding a protein that induces cell death, especially APAFI, RAIDD or Diablo/SMAC. A claimed method for inhibiting a cell's death cell with the nucleic acid under conditions permitting the nucleic acid under conditions permitting the nucleic acid to enter the cell, especially the use of a vector, liposome, or a meromatical or electrical means. The method is used to a treat a neurodegenerative disorder, especially a brain disorder or central nervous system disorder, or a heart disorder, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Qy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         caspase-3, caspase-7 or caspase-9 are detected. (I) is also useful for identifying a compound that inhibits Smac binding to Smac-binding molecule (a portion of IAP e.g. a BIR domain such as BIRI, BIR2 or BIR3, or a full-length IAP). (II) is useful in gene therapy techniques. The present sequence represents the amino acid sequence of Smac protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; DIABLO/Smac; cell death; u

                                                                                                                                                                                                                                                                      CC cancer patient. The method involves (a) measuring a level of a tumour up-
CC regulated CARD-containing antagonist of caspase 9 (TUCAN) in a neoplastic
CC cell-containing sample from the cancer patient; and (b) comparing the
CC level of TUCAN in the sample to a reference level of TUCAN, where a low
CC level of TUCAN in the sample correlates with increased survival of the
CC patient. Alternatively, the method involves measuring levels of TUCAN and
CC one or more biomarkers selected from the group of cIAP2, Apafl, Bcl-2, or
CC method is useful for determining a the patient is at risk for relapse,
CC or for determining a proper course of treatment for a patient with
CC cancer. The method is also useful for monitoring the effectiveness of a
CC course of treatment for a patient with cancer, cancer, intended the concer, breast cancer, ovarian cancer, lung cancer.
CC gastrointestinal cancer, melanoma, prostate cancer, or renal cancer. The
CC curse of treatment sequence represents a human Smac polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            QΥ

The invention relates to an isolated pro-apoptotic polypeptide, designated DIABLO, or its biologically active fragment of 8 amino acids in length. Also included are the polypnocleotide encoding DIABLO, expression vectors, transformed host cells, producing a biologically active fragment of DIABLO (by contacting an inhibitor of apoptosis (IAP) with a fragment of the polypeptide, and detecting a reduction in activity of the IAP), producing a natural or synthetic variant of DIABLO
                                                                                                                                                                                                                                                                                                                                                            New pro-apoptotic polypeptide, useful for screening for agents which modulate cell death and for treating conditions associated with cell death or apoptosis e.g. cancer \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              agent, which modulates the level and/or functional activity of a polypeptide), a composition for treatment/prophylaxis of a DIABLO relational polypeptide or DIABLO. DIABLO, or a nucleic acid encoding DIABLO, is useful for screening for an agent which modulates cell death. An antigen-binding molecule is useful for detecting DIABLO is antigen-binding molecule is useful for detecting DIABLO in a biological sample. The agent which modulates the level and/or functional activity of a sample.
                                                                                                                                                                                                                                                                                                           28-JUL-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of ct the 5602 nucleotide sequences defined in the specification, where the colligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises as sequence complementary to the ccomplementary strand of a polynucleotide which comprises a 5'-end cc sequence and an oligonucleotide comprises a 3'-end sequence, where the complementary to a combination of complementary to a complementary to the comprises a 3'-end sequence, where the cligonucleotide comprises a 3'-end sequence, where the cligonucleotide comprises a 3'-end sequence, where the combination of the 5'-end sequence,3'-end sequence is selected from those defined in ct he specification. The primer sets can be used in antisense therapy and cc in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and compresent oligonucleotides, and AAH13628 and AAH13633 to AAH13632 represent oligonucleotides, all of which are used in the exemplification.

CC of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                               Novel peptide derived from wild-type human second mitochondria activator of caspase protein useful for identifying candidate substances to kill cancerous cells -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Вb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a peptide derived from wild-type human second mitochondria derived activator of caspase (smac), also known as direct inhibitor of apoptosis binding protein with low pI (DIABLO). The peptide is one of 12 claimed smac (DIABLO)-derived peptides (see ABB76208-19) which bind to the Bir2 and Bir3 domain of XIAP, an inhibitor of apoptosis protein (IAP) family member. Kd values for Bir-3 and Bir-2 are 0.69 +/- 0.05 uM and 6.7 +/- 0.7 uM, respectively, for the present peptide, compared with 0.42 +/- 0.02 uM and 2.3 +/- 0.3 uM, respectively, for full-length smac. Modification of the N-terminal alanine destroys binding affinity to XIAP. For example, N-terminal alanine destroys binding affinity corplacement of the N-terminal alanine with glycine, propionic acid cor isobityric acid all resulted in Kd values for Bir-3 and for Bir-2 candidate substances which induce or promote apoptosis in cells. Compounds to disrupt the binding interaction between a smac (DIABLO)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The invention relates to polynucleotides encoding an Omi (serine protease) peptide or polypeptide. The Omi peptide specifically binds to portion of an Inhibitor of Apoptosis Protein (IAP). The Omi polypeptide induces caspase independent apoptosis, or fails to have serine protease activity. The Omi peptides are useful for regulating or altering apoptosis, specifically caspase-mediated apoptosis, and as immunogens for
                                                                                                                                                                                                                                                                                    New Omi nucleic acids and peptides that bind to an inhibitor of apoptosis proteins, useful for regulating or altering caspase-mediated apoptosis and for treating cancer, tumor, or autoimmune diseases \cdot

Enhancers of apoptosis are useful for treating cancers, tumours or for destroying cells that mediate autoimmune diseases. Compositions may also be used for the treatment of diseases associated with inappropriate activation of apoptosis such as neurodegenerative diseases and ischaemic injury. The antibodies can be used in isolating Omi peptides, polypeptides and their variants, in identifying molecules that interact with Omi peptides and polypeptides, and in inhibiting or enhancing the biological activity of Omi peptides and polypeptides. Sequences ABP71310-315 represent fragments of various TAP-binding proteins, used to determine Omi as a IAP-binding protein.
